

SOMMACT Self Optimising Measuring MACHine Tools

Grant Agreement no.: **CP-FP 229112-2**

Start Date: 2009-09-01

Duration: 36 month

SOMMACT

Partners:

ALESAMONTI S.r.l. (IT) - Project Coordinator

API VARESE (IT)

FIDIA S.p.A. (IT)

HAVLAT GmbH (DE)

IBS PE BV (NL)

INRIM (IT)

ISM-3D SL (SP)

KOVOSVIT MAS AS (CZ)

SUPSI (CH)

TTS S.r.l. (IT)

University of Huddersfield (UoH) (UK)

WEISS GmbH (DE)

Deliverable D2.4

Specification of the validation plan of the adopted technical solution

Document title: **D2.4 Dem_Valid_Plan_Draft00.doc**

Reference WP/Task: **WP2 / T2.4**

Lead Task beneficiary: **ALESAMONTI**

Authors: **Aldo PONTERIO / Renato OTTONE**

Date: **2010-10-08**

Revision: **00**

Status: **Draft** Final

Nature ¹⁾: **R**

Dissemination level ²⁾: **CO**

1) **R** = Report, **P** = Prototype, **D** = Demonstrator, **O** = Other

2) **PU** = Public, **PP** = Restricted to other programme participants, **RE** = Restricted to a group specified by the consortium, **CO** = Confidential, only for members of the consortium

Executive summary

This report provides the preliminary metrological specification of the SOMMACT project demonstrator.

Such specification derives from the conclusions of performed research tasks and from the results of on-going research activities. It is mainly based on the following:

1. T1.2 – *Identification of preferred application scope*. As documented in Deliverable D1.2 – *Report on preferred machine tool configurations and application fields*, selection criteria are broadly defined with respect to: (i) Machine tool type, (ii) Axes configuration, (iii) Axes size and (iv) On-board measuring system. Deliverable D1.2 also points out that even partial solutions deriving from SOMMACT project outcome could be very effective and that the selection of sensors and reference artefacts should also take into account the possibility of retrofitting them to existing machine tools, thus significantly increasing the effective exploitation of the project outcomes.
2. T2.1 – *Envisagement and analysis of error sources*. The corresponding Deliverable D2.1 – *Report on error sources analysis*, highlights the type of error the SOMMACT project shall concentrate on and also proposes a preliminary sensitivity analysis chart.
3. T1.3 – *System functional specification*. Deliverable D1.3 – *Specification of the system required functions*, discusses requirements and specifications of the various methodologies, systems and technology associated to the main SOMMACT features of (i) machine errors measurement, (ii) compensation, (iii) on-line measurement systems for continuous improvement, (iv) traceable on-machine inspection and (v) software for supervisor control and self-learning. It shall be noted that this Deliverable also contains the risk analysis associated to every specific topic.
4. The combination of the research work carried out in T2.2 *Investigation of the SEM (Separate Embedded Metrology) solution* and T2.3 *Investigation of the TiLOR (Timely Low-Order Recovery) solution*, documented in corresponding Deliverables D2.2 and D2.3, yields to conclude that the SOMMACT project “tool kit” will be a composition of the two solutions.

The SOMMACT demonstrator will be a real machine tool, based on the ALESAMONTI MAF45 boring/milling machine that, from the preliminary tests performed in T1.2, shows good sensitivity to both load variations and ambient temperature variations.

The technical specification of the machine, its mechanical interfaces to possible sensor systems and reference structures, as well as the specification of its foundation will be the object of Task T3.5 *Technical specification of the demonstrator*.

This report discusses economic and feasibility issues and points out which issues are most critical and require particular testing and validation.

The sequence of activities described in the Dow WP5 – *Demonstration* is considered and it drives (i) the sequential presentation of topics and (ii) the corresponding high level metrological specifications.

Table of contents

Executive summary.....	2
1 Introduction	6
2 Identification of critical issues.....	7
2.1 Economic issues.....	7
2.2 Feasibility issues and practical constraints.....	8
2.3 Selection of possible sensors systems and embedded reference frames set-ups.....	8
2.3.1 General.....	8
2.3.2 Individual axes error functions measurements.....	8
2.3.3 Measurement of relative position and orientation between the WCS and MCS.....	12
2.4 Identification of critical error functions and parameters	12
3 Demonstrator requirements	13
3.1 Machine tool	13
3.2 Foundation.....	16
3.3 “Tool kit”.....	16
3.4 Thermally controlled environment	17
3.5 Loading/unloading facilities for different masses.....	17
3.6 Anthropomorphic robot.....	17
3.7 Self-centring probe	18
3.8 On-machine inspection facilities including probe and measuring software	19
4 Determination of the effectiveness of the demonstrator test chamber.....	20
5 Thermal characterisation of the machine tool	21
5.1 General.....	21
5.2 ETVE test	21
5.2.1 ETVE test for standard stable ambient conditions	21
5.2.2 ETVE test for standard conditions of forced ambient variations.....	22
5.3 Thermal distortion caused by rotating spindle.....	22
5.3.1 General.....	22
5.3.2 Selection of spindle speed regime	23
5.4 Thermal distortion caused by linear motion of components	24
5.4.1 General.....	24
5.4.2 Proposed simplified test set-up and procedure	24
6 Standard geometric performance and functional tests.....	25
6.1 General.....	25
6.2 Geometric accuracy tests.....	25
6.3 Responsiveness test	28

6.4	Dynamic performance test.....	29
6.5	Spindle performance test.....	30
6.6	On-machine probing system performance test.....	30
7	Preliminary specification for mass variation tests	32
8	Preliminary specifications for ambient temperature variation tests	33
8.1.1	General.....	33
8.1.2	Standard stable ambient conditions	33
8.1.3	Pre-set stable ambient temperature conditions	33
8.1.4	Standard conditions of forced ambient variations	34
9	Preliminary determination of sensitivity of error functions to mass variations.....	35
9.1	General.....	35
9.2	Example for X-axis error functions sensitivity tests	35
10	Preliminary repeatability and stability tests	36
10.1	General	36
10.2	Monitoring of foundation deformation	36
10.3	Preliminary determination of repeatability associated to a set of error functions	36
10.4	Preliminary stability tests	36
11	Validation of SoA numerical compensation of geometric errors	37
12	Preliminary assessment of volumetric accuracy in unloaded state.....	38
13	Determination of SoA on-board inspection performances	39
13.1	General	39
13.2	Selection of artefacts that represent a calibrated test length	39
13.3	Measurement volume	39
13.4	Measuring software functional test	39
14	Individual sensor systems/artefacts preliminary validation test.....	40
14.1	General	40
14.2	Validation of sensor(s)/artefact(s) systems by independent instrumentation.....	40
14.3	Comparison between sensors/artefacts systems data and re-tuning artefacts data.....	40
14.4	Validation under mass variation and temperature variation conditions.....	41
15	Individual software modules validation.....	42
15.1	General	42
15.2	Validation of “researcher-oriented” development support modules	42
15.3	Timely integration of available test data for preliminary off-line validation	42
15.4	Individual validation of newly developed CNC compensation strategies	42
16	Individual and collective validation of SOMMACT project concepts	43
16.1	General	43
16.2	Stabilisation of machine tool performance under variable workpiece mass.....	43

16.3	Stabilisation of machine tool performance under variable ambient conditions	43
16.4	Performance, stability and traceability of on-machine inspection facilities	43
16.5	Assistance to the operator for re-tuning and re-calibration decision making	43
16.6	Prediction of machining performances.....	43
17	References.....	44
